What other kinds of automated tests can be performed?

Load and performance tests could also be performed in this application, to make sure how the application deals with great number of users simultaneously adding tasks at the same time for example.

At the same time, unit tests and integration tests would be of great help, for making easy to find which tests were failing and not let the test performance so slow, following the test pyramid.

Also, the application needs more attention in the UX side, since there is a bunch of situations that induce the user to make mistakes.

To make easier to write automated tests in the future, would be of a great help add Ids in the application properties.
So it could be possible to allocate all of them in a Locator file, where when writing new tests, would be easier, faster and organized to use them.
